

- NoSQL
- Fully Decentralized P2P
- No server required
- Implemented in JavaScript

# Fully Decentralized

# Client-side data storage

Enables offline-first abilities

Really fast access for locally available data

# Storage spaces

- Public space
- User space
- Frozen space

# Relay peer

Use of relay peers to enable P2P communication between clients and long term data persistence

# Data storage

Data is stored using a radix data-storage

RAD produces JSON objects which can be stored on any file or object storages (file, S3, localStorage)

# CAP Theorem

AP database

Eventually consistent  
Always available (although may be empty)  
Partitioning is one of the core principles

# Consistency

# Update consistency

Use of the HAM conflict-resolution algorithm

HAM: Hypothetical Amnesia Machine

# Update consistency

It's an optimistic algorithm, all updates are stored  
and merged if possible

Only the last known value is presented

# Read consistency

No native transactions available  
Read inconsistencies can happen  
Partial reads can also happen

# Read-your-writes consistency

As data is first stored locally then replicated, all reads from your writes will be read first from the local storage, ensuring read-your-writes consistency

# Built-in secure user management

Based on Security, Encryption, & Authorization -  
SEA

# User security

Based on asymmetric encryption & signing methods

The only way to find the private keys for a user is to use a combination of his alias, public key and password

# User security

You are only allowed to write child nodes to a user node if you have the private key for that user

# Our example

An online realtime checkers game, with chat  
between players

# DEMO TIME

## Conversations

**amael aeYiF**  
poun

Hello

How are you today

I'm fine, thank you

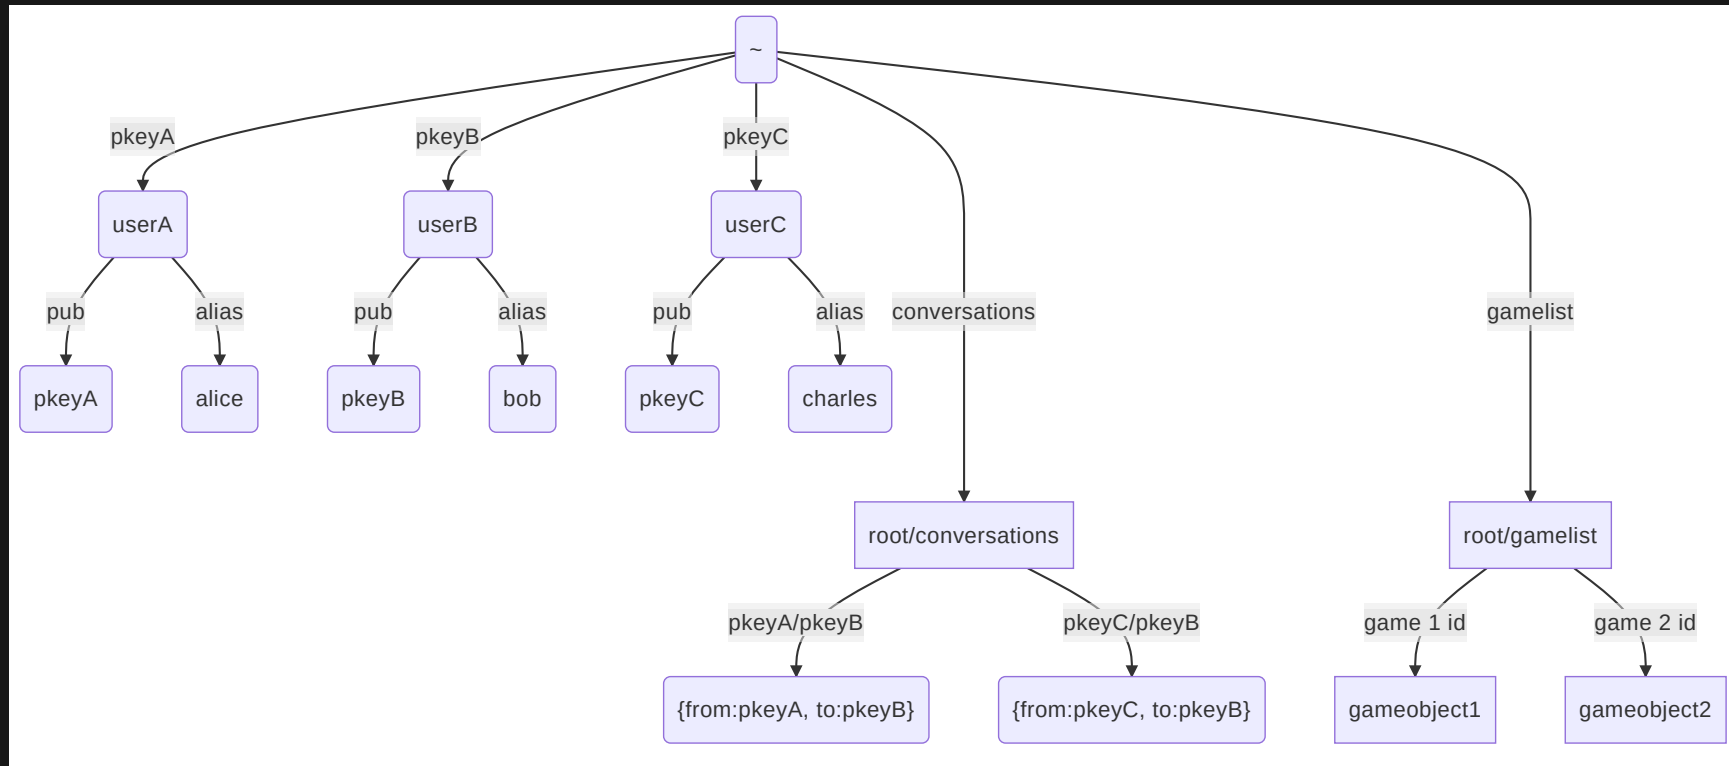

cool dude

# Checkers
